Start with intent, then run a repeatable flow

RenderPackage is built for AI-era writer/directors: faster iteration, cleaner continuity decisions, less avoidable rework.

PACKAGE MAP

Package map
(PACKAGE_MAP.md)

Creator guide
(you are here)

Quick way to work: follow the map once, then stay in the flow. The package structure stays stable while your creative choices evolve.

SCENE SNAPSHOT

Scene ID	scn_49132c8a016b
Shot Count	8
Heading	INT. APARTMENT KITCHEN - MORNING

References are your continuity anchor

Drift is normal. Strong references will not make output deterministic, but they give you much tighter control shot to shot.

- Start with a minimal kit: core cast, key location looks, style anchor, hero props.
- Use clean naming and neutral lighting to keep generations legible and reusable.
- Store refs exactly where the package expects them so production rhythm stays friction-free.
- Picture-first rule: keep source images free of burned text, subtitle overlays, and watermarks.

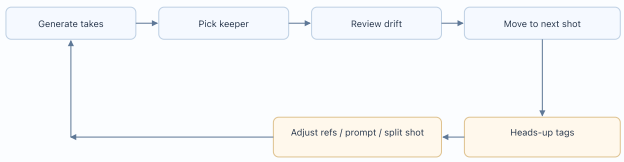
Run takes as a loop, not a lottery

Generate options, review quickly, mark the keeper, then only fix what drifted. That is where most time savings happen.

Diagram 2: Take loop



Heads-up tags to watch: dialogue-heavy beats, multi-character blocking, hero-prop continuity, and complex motion.

Cut picture first, then finish sound in post

Modern tools, same craft standard: shape the rough cut first, then layer ADR/VO, SFX, ambience, and final mix.

Picture-first policy

- No burned-in text, subtitles, or captions in picture outputs.
- If on-screen text appears, reroll that shot instead of trying to “repair” it downstream.
- Once the rough cut lands, finalize ADR/VO, SFX cues, and mix decisions against locked timing.

Keepers turn taste into a system

The goal is not perfect determinism. The goal is repeatable decision quality while you iterate toward final picture.

- Use the Keeper Sheet to lock one keeper per shot and capture why it earned the pick.
- If continuity slips, reroll the failing beat, or split a crowded shot into simpler parts.
- Protect what already works, then iterate toward a confident export.
